

# Photon Overlap Removal for top FCNC

$$t \rightarrow q\gamma$$

Jason Barkeloo

April 26, 2018

# Table of Contents

# Top Quark Decays

- Standard model top branching ratio to  $bW \simeq 100\%$

Figure: Leptonic final state diagram for a top decay

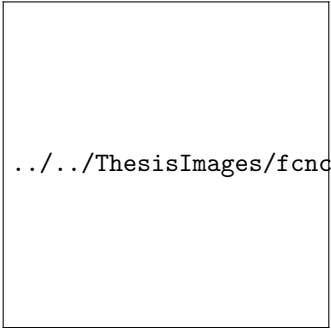

Figure: Top quark pair decay final states [Nature]

# Top Quark Decays in the SM

../../../../ThesisImages/SMTopDecays.png

# FCNC: What are we looking for? $t\bar{t} \rightarrow W(\rightarrow l\nu)b + q\gamma$

- ▶ Final state topology
  - ▶ One Neutrino, from W
  - ▶ One Lepton, from W
  - ▶ One B-jet, SM top
  - ▶ **One Photon, FCNC Top**
  - ▶ One Jet, FCNC Top

../../../../ThesisImages/fcnc\_ttb\_bar.png

# Background Processes

- ▶ Due to all of the processes at hadron colliders it is important to model similar event topologies well.
- ▶ Major backgrounds include  $t\bar{t}$ ,  $W$ +Jets,  $Z$ +Jets, + processes with an associated photon

../../../../ThesisImages/backgrounds.png

# Monte Carlo Generation

- ▶ All of our MC data is put through a showering algorithm for propagation from final decay states
- ▶ Various showering algorithms are used at ATLAS - Pythia, Herwigg, etc.
- ▶ All of these will add radiative photons
- ▶ These events can be contained in other samples with explicit photons originating from the hard interaction
- ▶ Need to remove these events or risk double counting events

# Photon Overlap Removal

- ▶ Truth matching procedure is used to identify origin and type of truth particle corresponding to reconstructed photon
  - ▶ If reco photon is associated with a truth electron or within  $R=0.2$  we can consider this  $e \rightarrow \gamma$  fake
  - ▶ If origination from boson or lepton with a corresponding truth hadron: hadron fake
  - ▶ Otherwise the photon is considered coming from the hard interaction
  - ▶ The procedure rejects less than 1% of events in  $t\bar{t} + \gamma$  and  $V + \gamma$  samples (except  $Z + \gamma$  in e+jets channel because of fake rates)

# Photon Overlap Removal

- ▶ For  $t\bar{t}$  and  $V + jets$  samples, the prompt photon contribution is subject to large statistical uncertainty and its modelling is less trusted, it is why the  $t\bar{t} + \gamma$  and  $V + \gamma$  samples are used.
- ▶ For this to work phase spaces of events must be close to identical otherwise the overlap removal will take out too much

../../../../ThesisImages/OverlapRemovalTTgam.png

# Object Preselection

- ▶ We preselect events with objects that look like our expected topology
- ▶ Reminder that I require:
  - ▶ Exactly one lepton ( $e$  or  $\mu$ )  $\geq 28$  GeV
  - ▶ Exactly one Good photon  $\geq 25$  GeV
  - ▶ Missing Transverse Energy  $\geq 30$  GeV
  - ▶  $\geq 2$  Jets (at least one being b-tagged)
- ▶ All following plots will have signal scaled to 0.2% of nonallhadronic  $\sigma_{t\bar{t}}$ , MC scaled to  $36.07 \text{ fb}^{-1}$
- ▶ Only electron channel shown. Similar results for the muon channel are seen.

# Preselection Objects

► Leading Jet  $p_T$

► Photons

► Leptons

No OVR

../../../../ThesisImages/plots/loose/No\_OVR/LeadingJet/photons/leptons/

W/OVR

../../../../ThesisImages/OverlapRemoval/Region/OverlapRemoval/Region/

## What does this mean?

- ▶ Previous presentations have dramatically overcounted  $t\bar{t}$  events
- ▶ 40 – 50% of the events in  $t\bar{t}$  and  $W + jets$  base samples are removed with this procedure
- ▶ The inclusion could have hidden some potential differences in ways to remove one or the other background processes

Figure: No OVR Photon ptcone20

Figure: OVR Photon ptcone20

# Other Variables

►  $\Delta R_{\gamma l}$

►  $\gamma_{\theta}$

No OVR

W/OVR

../../../../ThesisImages/plotsloose/el\_h\_ph/ThesisImages/plotsloose/

../../../../ThesisImages/OverlapRemovalNoRegion/plotsloose/OverlapRemovalNoRegion/

# Signal Region

- ▶ Current Requirements:
  - ▶ Preselection Cuts
  - ▶ FCNC Top Mass:  $m_{q\gamma}$  within 50GeV of  $m_t$
  - ▶ SM Top Mass:  $m_{b\nu}$  within 50GeV of  $m_t$
  - ▶ Z Mass:  $m_{l\gamma} > 10\text{GeV}$  from  $m_Z$
  - ▶ Photon  $p_t > 50\text{GeV}$
  - ▶  $=1$  Bjet

## Some SR Variables

►  $\Delta R_{I\gamma}$

►  $\gamma_{\Theta}$

## PreSelection

## SR Cuts

../../../../ThesisImages/OverlapRemovalNoReg/ThenSpliced/OverlappedRedm

```
../../../../ThesisImages/OverlapRemovalRegion/slides/Images_Slides_09.png
```

## Some More SR Variables

►  $m_{q\gamma}$

►  $m_{bl\nu}$

## PreSelection

## SR Cuts

../../../../ThesisImages/OverlapRemovalNoReg/ThesisImages/OverlapRemo

../../../../ThesisImages/OverlapRemovalRegions/ThesisImages/OverlapRemovalRegions/

## $t\bar{t} + \gamma$ rich region

- ▶ Preselection Cuts
- ▶ FCNC Top Mass - Orthogonal to SR
- ▶  $\geq 4$  Jets

Figure:  $\gamma_e$

Figure:  $\Delta R_{l\gamma}$

# Other Regions

- ▶ Developing more region to test the performance of MC samples
- ▶ Regions are designed to isolate various physics processes using orthogonal selections
- ▶  $t\bar{t}(+\gamma)$  is of utmost important to model extremely well, especially with the increase in cross section at 13TeV

# Conclusion, Outlook

- ▶ Orthogonal validation/control regions are in development
- ▶ Data grid run complete, need to incorporate into CR/VR plots
- ▶ Next grid run will include a couple of looser regions for CR/VRs
  - ▶ 0 Photon Samples for Backgrounds with no Real Photons
  - ▶ 0 BJet Samples - possibly for WJets region
- ▶ Top Group - Pushing for MVA, want to start investigations using these techniques

# Backup

# Integrated Luminosity

../../../../ThesisImages/2017PeakLumiByFill.pdf

# A Couple BSM Diagrams

../../../../ThesisImages/BSMDiagrams.png

$$d_{ij} = \min\left(\frac{1}{p_{ti}^2}, \frac{1}{p_{tj}^2}\right) \frac{\Delta_{ij}^2}{R^2}$$

$$d_{iB} = \frac{1}{p_{ti}^2}$$

$$\Delta_{ij}^2 = (\eta_i - \eta_j)^2 + (\phi_i - \phi_j)^2$$

- ▶ Find minimum of entire set of  $\{d_{ij}, d_{iB}\}$
- ▶ If  $d_{ij}$  is the minimum particles  $i, j$  are combined into one particle and removed from the list of particles
- ▶ If  $d_{iB}$  is the minimum  $i$  is labelled as a final jet and removed from the list of particles
- ▶ Repeat until all particles are part of a jet with distance between jet axes  $\Delta_{ij}$  is greater than  $R$

# B-tagging

../../../../ThesisImages/B-tagging\_diagram.png

$$\mathcal{L}_{tq\gamma}^{\text{eff}} = -e\bar{c}\frac{i\sigma^{\mu\nu}q_\nu}{m_t}(\lambda_{ct}^L P_L + \lambda_{ct}^R P_R)tA_\mu + H.c.$$
